AI Chat Transcripts

Team 41 · Team code PPNKD · Cycle 3 (Grades 9–12) · 6th Annual COE STEM Programming with AI Competition · 29 October 2026

AI used: Claude (Anthropic), one conversation, 15:51–17:30 UAE time. All coding and design work in this project happened in this conversation.

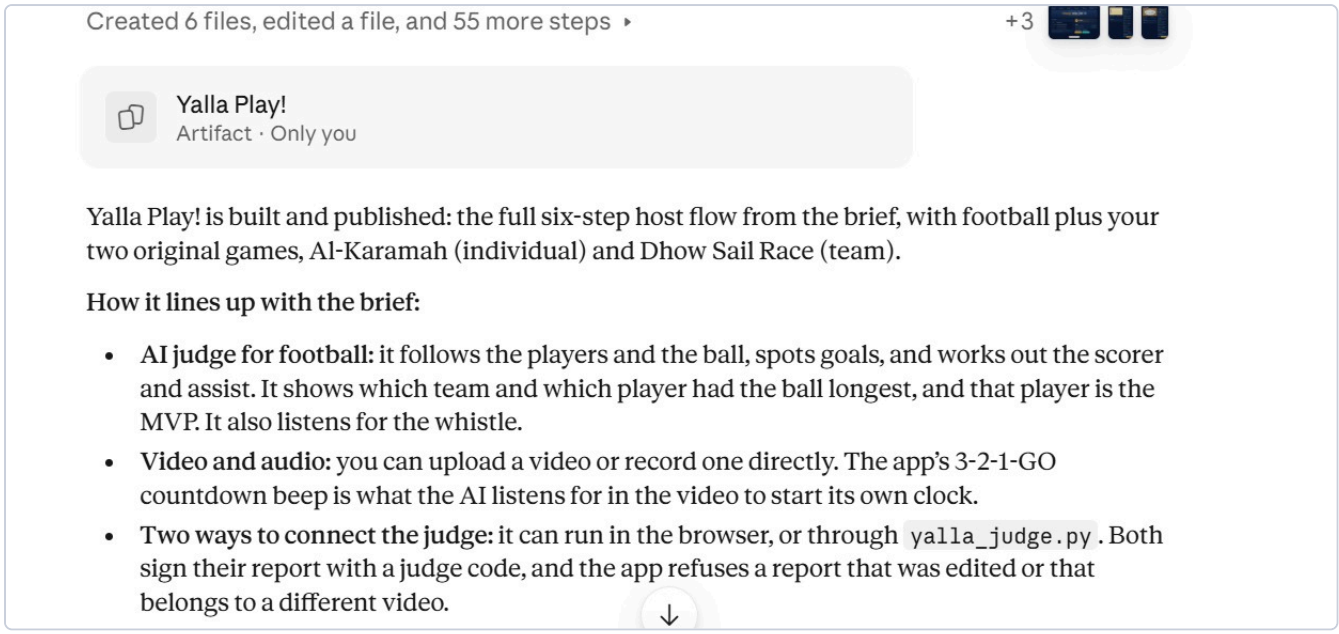

Conversation log

Time	Our prompt	What the AI did
15:51	Shared the master development prompt for Yalla Play! (3 games: Football AI Referee, Al-Karamah, Dhow Sail Race).	Claude offered three options: build a working prototype, tighten the prompt, or plan the build; flagged that serious football tracking needs a backend.
15:52	“build a working prototype feel free to add any improvements from our idea based on these instructions: [Google Doc link]”	Claude tried to open the Google Doc; it needed a sign-in, so Claude asked for the text or screenshots.
15:55	Sent 3 screenshots of the competition brief (Family AI Game Day) — “please use these instructions rigorously”.	Claude built the full prototype: 6-step host flow, in-browser computer-vision + audio AI judge, signed reports, Python judge, synthetic test clips; tested all three games end to end and published the app.
16:28	“make the football section slightly easier to navigate and allow different coloured clothes as it's not an official match but a family match”	Claude switched football to per-player clothes colours (taught by one click per player), added a guided step-by-step marking banner, removed clutter, retested with a mixed-clothes clip.
16:44	“I am unable to add players, the button brings me back to the top”	Claude found the page re-render scrolled to the top; fixed it to keep position and focus the new player’s name box; tested on desktop and phone sizes.
16:47–16:55	“open this in Claude” / “give me the code used for this too” / “give artifact too”	Claude opened the app and shared the full source (engine.js, app.js, style.css, yalla_judge.py, build + tests) and index.html.
17:01	“I can't load synthetic test clip”	Claude embedded the test clips and Python judge inside the page so nothing has to be fetched; verified by opening index.html with no server.
17:29	Shared the submission requirements; asked for the transcripts with the earlier pictures.	Claude produced this transcript PDF, the technical report and the presentation deck.

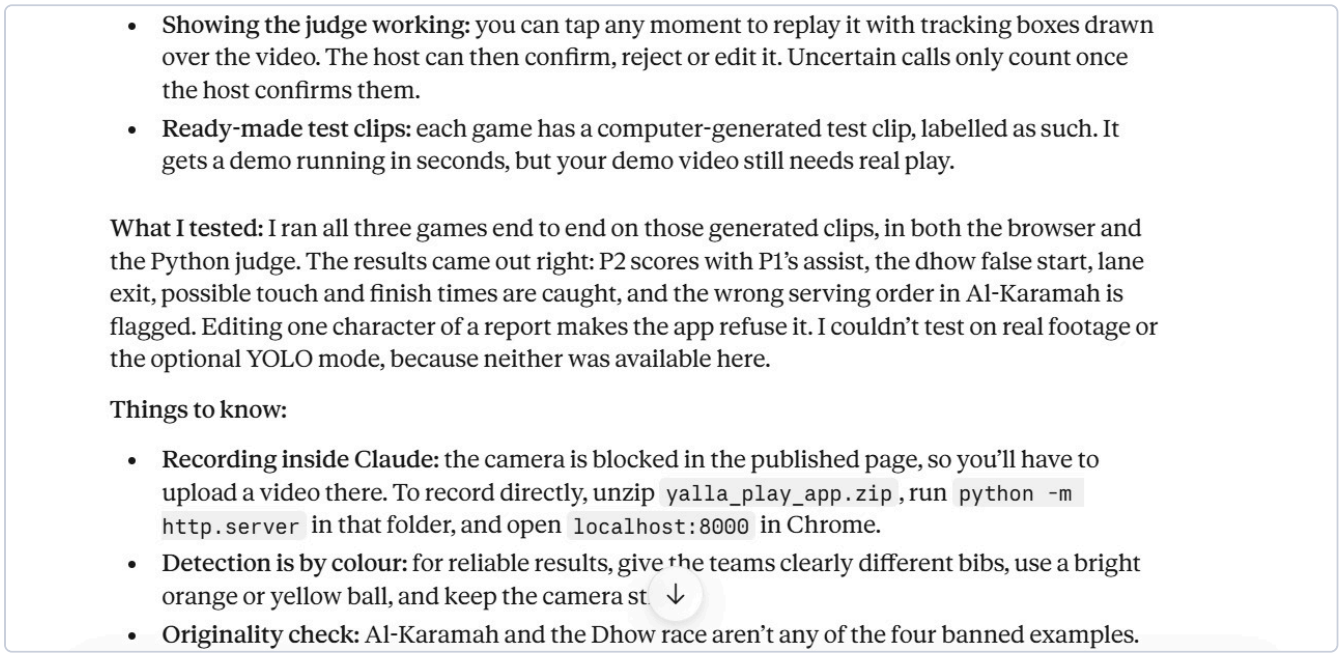

How we used the AI

- We wrote the game ideas and the master prompt ourselves, then used the AI to build, test and debug the app.
- We tested the app ourselves and reported problems (clothes colours, Add player button, test clip loading); the AI fixed each one.
- The following pages are screenshots of the conversation and of the competition brief we gave the AI.

- **Shirt numbers:** these are optional now. I also removed the position dropdown to cut clutter.
- **Matching outfits are fine:** if two people wear similar colours, the AI tells them apart by how they move. It warns you to check the replay when they cross.

Easier setup:

- **Guided marking:** a banner above the video takes you through it in order: box the two goals, click on each player, click the ball. Marking the pitch edges is now an optional last step.
- **Navigation:** it moves to the next step on its own, with "Back" and "Skip" buttons. When everything's marked, the Analyse button appears right there.

Tested:

- **Mixed-clothes test clip:** I made a new synthetic clip with players in red, purple, white and blue across the two teams. The browser judge got the right goal, scorer and assist, and so did the Python judge.
- **Other checks:** the full football flow, the Python report import and its tamper check all still pass.
- **Test clip button:** in football it now loads this n… …d-clothes clip.

Two caveats for real games. Pick a ball that stands out from what everyone's wearing; bright orange is ideal. And if someone wears green, the AI may mix them up with the grass.

`yalla_play_app.zip` and `yalla_judge.py` are the updated versions of both.
